Explain, what are the multiple ways to create a new dataflow?

Ans: The multiple ways to create a new data flow in Power BI service are:

## 1. From Power BI Workspace

- Navigate to your workspace in Power BI Service.
- Click "New" → "Dataflow".
- Choose "Define new tables" or "Import model" to begin.

## 2. Using Power Query Online

- When creating a dataflow, Power BI launches Power Query Editor in the browser.
- You can connect to various sources like Excel, SQL Server, SharePoint, etc.
- Apply transformations just like in Power BI Desktop.

## 3. Importing Existing Models

- You can reuse existing Power BI Desktop models or other dataflows.
- Select "Import model" when creating a new dataflow.
- This promotes consistency and reduces duplication.

## 4. Linked and Computed Tables (Premium Feature)

- In Premium workspaces, you can create linked tables from other dataflows.
- You can also define computed tables that perform transformations on linked data.
