1. After how much duration of inactivity, scheduled refresh will get pause?

   Ans: Scheduled refresh in Power BI Service automatically pauses after 60 days of inactivity. This means if no one views or interacts with the dataset/report for 60 consecutive days, Power BI will stop refreshing the data to conserve resources. You'll need to manually resume the refresh or trigger activity to restart it.

2. For which licensed user, dataflow creation is possible?

   Ans: Dataflow creation is available only to licensed Power BI Pro or Premium Per User (PPU) users.
